

V6.0 Feature list

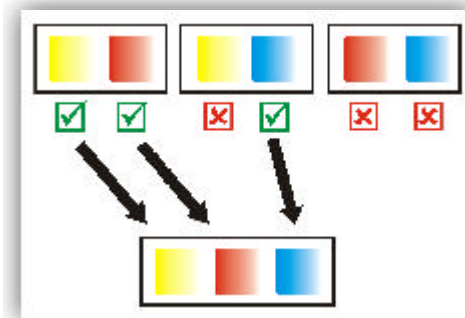

- De-dupe & Global SIS
- Advanced Encryption Standard
- Multiple Backup Sets
- 64-bit SP support
- NTFS Change Journal support
- .NET platform
- HTML backup selection reports
- Account moves
- Backup Throttle enhancements
- MS SQL database
- "Snapshots made easy"
- Plug-ins
- Roll-up limits
- File/folder exclusion options
- Installer enhancements
- Report web access

What's New in V6.0?

De-dupe & Global SIS

V6.0 achieves de-duplication across all Backup Accounts by combining the Attix5 patching process and individual file Single-instance storage. This enables:

- Less disk space usage - Only one copy of each file is stored (even across multiple Accounts)
- Less bandwidth usage
- Faster backups

Advanced Encryption Standard

Attix5 Pro V6.0 uses the Advanced Encryption Standard (AES) to encrypt data on the Storage Platform. This industry standard encryption cipher is faster and more secure than Blowfish and many new processors have built-in hardware to render it even faster.

Multiple Backup Sets

Create multiple sets of selections and schedules for backups and restores.

HTML backup selection reports

Export a list of all backup inclusions and exclusions to an html file for sign-off.

NTFS Change Journal support

V6.0 supports the use of Microsoft's NTFS Change Journal, using it to enable faster pre-backup scans.

64-bit Storage Platform support

V6.0 Storage Platforms can run in 64-bit mode, which enables full use of all available memory on a 64-bit Operating System.

.Net platform

The use of .Net for the V6.0 Attix5 Pro platform results in the following advantages:

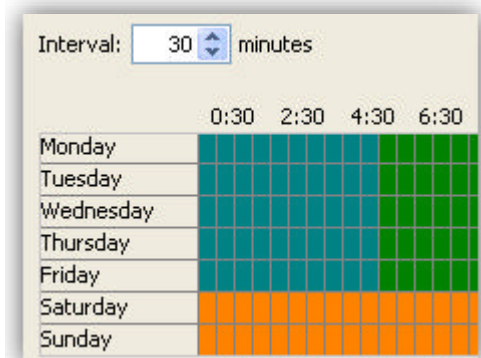

- Improved multi-threading support
- Simultaneous Backups/Restores and Integrity Check per Account
- Faster HSM processes
- ReportServer – AccountServer integration
- Advanced event queuing

Account moves

- Perform Account moves with automatic licence re-allocation.

Backup Throttle enhancements

Set different Client-to-SP throttle values for different times of the day using the Backup Throttle Map.

V6.0 Feature list

- De-dupe & Global SIS
- Advanced Encryption Standard
- Multiple Backup Sets
- 64-bit SP support
- NTFS Change Journal support
- .NET platform
- HTML backup selection reports
- Account moves
- Backup Throttle enhancements
- MS SQL database
- "Snapshots made easy"
- Plug-ins
- Roll-up limits
- File/folder exclusion options
- Installer enhancements
- Report web access

MS SQL database

V6.0 uses MS SQL instead of the BDE database, with the following advantages:

- Better performance and stability
- Enables users to write their own queries
- Combines the AccountServer and ReportServer databases
- Easier report writing and integration (e.g. Crystal Reports)
- Reduced maintenance load

"Snapshots made easy"

V6.0 introduces simplified Snapshot backup to disk and Snapshot restore features with off-line medium support; making disaster recovery faster and easier than ever before.

Plug-ins

SharePoint 2007, System State, VMware and Exchange (with single email restore capability) plug-ins now available.

Minute-specific backup start times

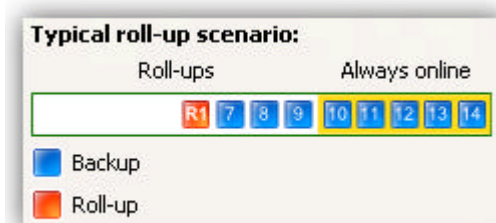

Specify exact backup initiation times, down to the minute.

Example: Start backup at:
00:14.

Roll-up limits

Apart from the traditional month-end roll-ups, Backup Administrators can now also limit the number of backups stored online.

File/folder exclusion options

- V6.0 filters enable the system-wide exclusion of files and folders from the backup selection based on file names, types or modification dates.
- Exclude files and folders during restores.

Installer enhancements

Improved SP, SP Console, SE and DL installers make all installations faster and easier.

Note: Spanish and German deployment wizards now available.

Report web access

Access Standard and Enterprise reports using any web browser. Simply log in using your Administrator login credentials and view the latest SP reports in HTML.
